MDB INDUSTRIES

Profile Book

Inside you will find an illustrative guide to common trim, door, coverings, and staircasing designs, and staircase parts, but it is intended as a starting point only; almost any part or piece can mix and match another to create exactly the unique style you are looking for.

We do not stock any profiles. Everything is run on an as-needed basis. This Profile Book is incomplete, as it is not updated with every profile we have and can run. If you don't see what you are looking for, wish to have a new one designed, or need to exactly match an existing profile, we are happy to create it for you.

Profile dimensions can often be adjusted within reason, as well as additional features such as tongue and grooving, chamfering, rebate cut's etc. added. Typically, a back-out relief cut or "plow" is used on the backside of the board, but may not be represented in these images. Some profiles, however, do not allow the use of a relief cut as it ruins the structural integrity of the piece.

The profiles are organized within this book by their typical or ordered use, but that doesn't mean they cannot be used otherwise. For example, crown angles can be milled onto a casing, or a casing can be used as a chair rail. Profiles that have a significant amount of flat or non-profiled area can often be adjusted for height or width.

We also offer a selection of wall and ceiling coverings, as well as flooring and miscellaneous profiles for special projects. Our staircasing section provides information regarding turnings and other stair parts to make on-site fabrication easier and more cost effective, or for repair and restoration.

MDB Industries is happy to work with customer supplied materials. Our sawing and kiln drying capabilities enables us process your timber, standing or downed, into ready to install product for your home or project. We can also supply raw or dressed (S4S) stock with your mouldings for cabinet construction or other on-site projects.

Thank you again for choosing MDB Industries for your Architectural Millwork needs. We look forward to working with you on your project!

G Profile Examples

Casings

Two-Part Base Solid Base

Solid Bases have a maximum height of 9". For taller bases, a Two-Part system is used, as demonstrated above. A Tongue & Groove joint is used for a secure and flush fit.

MDB Industries produces custom flooring for customers with difficult to find requirements or needs. Typically, our flooring is either from the customer's own timber, exotic or unusual species, or length and width requirements not readily available on the commercial market. However, we are happy to quote you on any flooring need you may have.

Our flooring is milled with a true flooring profile (shown below) with a nailing slot milled above the tongue, and 1/32" off-set between the upper tongue edge and the lower tongue edge. This assures that during installation, the nail head has space to fully seat, and the upper edge fully contacts the board next to it without interference from the lower edge. On boards over 6" wide, a center fastener is recommended. This can be either nailing from the top through the board, or a screw from underneath through the sub-floor into the floorboard.

Flooring Profiles are available in a variety of thicknesses, species, and up to 9" widths.
